# Gibbs Free Energy ( G<sup>0</sup>)

## 1. What is Gibbs free energy & why it is important?

The total entropy which includes the system & surrounding was used previously to predict the feasibility of a reaction. In chemical thermodynamics it's often preferred to focus on the system than the surroundings. Free energy enables us to do this for changes that occur at constant temperature and pressure. (Not necessary at standard conditions).

Gibbs free energy refers to the amount of energy of the system available to do work. This energy is referred to as the "FREE" energy as it is the remaining energy of the system after it had used some of its energy for entropy. Since this was discovered by J.Willard Gibbs it is called as Gibbs Free Energy. Symbolized by  $\Delta G$ .

Gibbs free energy is important to predict the feasibility of a reaction where feasibility cannot be predicted when enthalpy & entropy is considered together. Eg: Reaction which is feasible with respect to enthalpy but not entropy (exothermic reaction with negative entropy) or Feasible with respect to entropy but not enthalpy. (Endothermic reaction with positive entropy)

## 2. Define Standard Gibbs free energy change, $\Delta G^{\theta}$

Gibbs free energy / Gibbs function is the combination of entropy and enthalpy. The change in the Gibbs free energy of the system that occurs during a reaction is therefore equal to the change in the enthalpy of the system minus the change in the product of the temperature times the entropy of the system. And can be defined by the following equation:

$$\Delta \mathbf{G}^{\boldsymbol{\Theta}} = \Delta \mathbf{H}^{\boldsymbol{\Theta}} - \mathbf{T} \Delta \mathbf{S}^{\boldsymbol{\Theta}}$$

Where,  $\Delta H^{\underline{\theta}}$  is the standard enthalpy change of the reaction. (298K, 1atm) T is the temperature in Kelvin

 $\Delta S^{\theta}$  is the standard entropy change of the system.

 $\Delta G^{\theta}$  is the standard Gibbs free energy. Remember that the superscript  $\theta$  on  $\Delta G^{\theta}$  indicates that the numerical value of Gibbs free energy is based on the reaction at standard conditions and it refers to 1M concentrated solution & 1 atm pressure. Temperature is NOT a part of standard conditions for  $\Delta G^{\theta}$ .

3. Derive the Gibbs free energy equation from total entropy equation. Gibbs free energy change is given by the equation  $\Delta G = -T\Delta S_{total}$ 

4. Define the term Standard molar Gibbs free energy of formation.

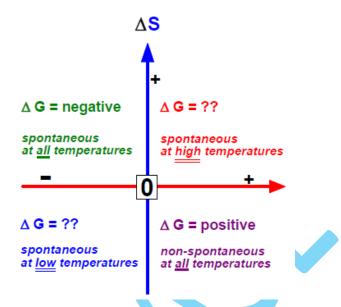

Standard molar Gibbs free energy of formation is the free energy change which accompanies the formation of one mole of a compound from its elements in their standard state. Symbolized by  $\Delta G^{\theta_f}$  and units are kJmol<sup>-1</sup>

5. Explain how ΔG determines the direction & extent of a chemical change hence spontaneity.

Δ <i>G</i> < 0	reaction can spontaneously proceed to the right: $\mathbf{A} \to \mathbf{B}$
$\Delta G > 0$	reaction can spontaneously proceed to the left: $\mathbf{A} \leftarrow \mathbf{B}$
$\Delta G = 0$	the reaction is at <i>equilibrium</i> ; the quantities of A and B will not change

Thus negative  $\Delta G$  indicates that the reaction is spontaneous, a positive  $\Delta G$  indicates a non-spontaneous reaction and if  $\Delta G$  is zero the reaction is at equilibrium.  $\Delta G^{\Theta_{\rm f}}$  is a measure of the stability of the compound. Greater the negative value greater the stability thus difficult to decompose and vice versa.

> The  $\Delta G_{f}^{\Theta}$  of an element under standard condition is zero. (Eg:H<sub>2</sub>,O<sub>2</sub>,Br<sub>2</sub>,C,Mg,Na) **6**. Discuss the effect of temperature on spontaneity of a reaction

As  $\Delta G = \Delta H - T\Delta S$ ,  $\Delta G$  changes with temperature.

 $\Delta$ H could be negative (an exothermic reaction) or positive (an endothermic reaction). Similarly  $\Delta$ S could be either positive or negative. Thus there are four possible combinations of the signs of  $\Delta$ H and  $\Delta$ S

### **a**. $\Delta H$ is negative and $\Delta S$ is positive:

As both  $\Delta H$  and  $-T\Delta S$  terms are negative irrespective of the temperature,  $\Delta G$  is also will to be negative. The reaction will be spontaneous at all temperatures.

**b**.  $\Delta H$  is positive and  $\Delta S$  is negative :

As both  $\Delta H$  and  $-T\Delta S$  terms are positive irrespective of the temperature,  $\Delta G$  is also will be positive. The reaction will not be spontaneous at any temperature.

**c**.  $\Delta H$  is positive and  $\Delta S$  is positive :

 $\Delta H$  is positive. -T $\Delta S$  is negative.

Increasing the temperature will result  $-T\Delta S$  will become more negative, and will eventually outweigh  $\Delta H$  thus the reaction will be spontaneous. But at low temperatures,  $\Delta G$  becomes positive thus the reaction will be non spontaneous. Eq : Decomposition of  $CaCO_3$  **d**.  $\Delta$ H is negative and  $\Delta$ S is negative :

 $\Delta H$  is negative. -T $\Delta S$  is positive.

As temperature increases, -T $\Delta$ S will become more positive, and will eventually outweigh the effect of  $\Delta$ H thus reaction will be non spontaneous. But at low temperatures  $\Delta$ G will be negative thus be spontaneous.

7. State the factors which is to be considered when Calculating  $\Delta G^\circ$  hence explain how  $\Delta G$  of a reaction is calculated.

 $\Delta G^{\circ}$  and  $\Delta H^{\circ}$  are both measured in kJmol<sup>-1</sup> whereas the entropy change is calculated in JK<sup>-1</sup>mol<sup>-1</sup>, Thus one must change the entropy change value into kJ before when calculating  $\Delta G^{\circ}$ .

Similar to enthalpies and entropies the standard Gibbs free energy of a reaction can be calculated as to the below equation:

$$\Delta G^{\circ} = \sum n \Delta G^{\circ}_{\text{(products)}} - \sum n \Delta G^{\circ}_{\text{(reactants)}} \qquad n = \text{no.of moles}$$

8. Calculate the  $\Delta G^{\circ}$  in below examples hence comment on the feasibility of the reaction.

I.  $C_{(graphite)} + O_{2(g)} \longrightarrow CO_{2(g)}$ 

Calculate  $\Delta G^{\circ}$  for CO<sub>2</sub> at 298 K.  $\Delta H^{\circ}(CO_2) = -393$  KJ/mol, S° (O<sub>2</sub>) = 205 J/mol.K , S°(C) = 6 J/mol.K, S° (CO<sub>2</sub>) = 213 J/mol.K

II.  $C_{(graphite)} + O_{2(g)} \longrightarrow 2CO_{(g)}$ 

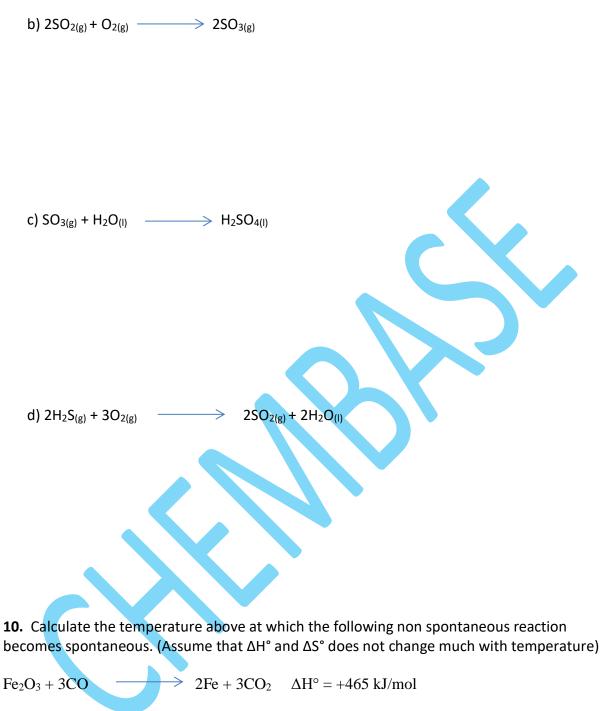

Calculate  $\Delta G^{\circ}$  for CO at 298 K.  $\Delta H_{f}^{\circ}$  (CO) = -110 KJ/mol, S°(O<sub>2</sub>) = 205 J/mol.K, S°(C) = 6 J/mol.K, S°(CO) = 198 J/mol.K

III.  $2Na_{(s)} + O_{2(g)} \longrightarrow Na_2O_{2(s)}$ 

Calculate  $\Delta G^{\circ}$  for the reaction at 298 K.  $\Delta H = -510$  KJ/mol, S°(Na) = 51.2 J/mol.K, S°(Na<sub>2</sub>O<sub>2</sub>) = 95.0 J/mol.K, S°(O<sub>2</sub>) = 205.0 J/mol.K

9. Calculate  $\Delta G^{\circ}$  for the following Reactions, Given that;

 $\begin{array}{lll} \Delta G^{\circ}{}_{\rm f} \left( {\rm SO}_{2,\,\,{\rm g}} \right) &= -300\,\,{\rm kJ/mol} & \Delta G^{\circ}{}_{\rm f} \left( {\rm SO}_{3,\,\,{\rm g}} \right) &= -371\,\,{\rm kJ/mol} \\ \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm SO}_{4,\,\,{\rm i}} \right) &= -690\,\,{\rm kJ/mol} & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm SO}_{4,\,\,{\rm aq}} \right) &= -742\,\,{\rm kJ/mol} \\ \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm O}_{,\,\,{\rm i}} \right) &= -237\,\,{\rm kJ/mol} & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/mol} \\ & \Delta G^{\circ}{}_{\rm f} \left( {\rm H}_{2}{\rm S}_{,\,\,{\rm g}} \right) &= -34\,\,{\rm kJ/m$ 

 $\Delta S^{\circ} = +552 \text{ J/molK}$  $\Delta G^{\circ} = +301 \text{ kJ/mol} (at 298 \text{ K})$  11. With the help of a Gibbs free energy cycle calculate  $\Delta G^{\theta_{f}}$  for the below decomposition, hence comment on the feasibility.

 $2NaHCO_{3(s)} \longrightarrow Na_2CO_{3(s)} + CO_{2(g)} + H_2O_{(l)}$ 

The relevant  $\Delta G^{\theta}_{f}$  values are :

 $\Delta \mathcal{G}^{\theta}_{f}[\text{NaHCO}_{3(s)}] = -850 \text{ kJmol}^{-1} \qquad \Delta \mathcal{G}^{\theta}_{f}[\text{H}_{2}\text{O}_{(1)}] = -235. \text{ kJmol}^{-1} \\ \Delta \mathcal{G}^{\theta}_{f}[\text{CO}_{2g}] = -390 \text{ kJmol}^{-1}, \qquad \Delta \mathcal{G}^{\theta}_{f}[\text{Na}_{2}\text{CO}_{3(s)}] = -1045 \text{ kJmol}^{-1}$
